What happens if you do not replace the brake pads?

1 ? ? ?
What is that squealing noise when you apply the brakes?

2 Bring your car to a Mitsubishi authorized dealer for an inspection ...or ...

4 Oh no... the brakes are weak!
The steering response seems poor!

3 You apply the brakes the same as usual ...but...

Why does this happen?

The brake pads use the force of friction to slow the vehicle. Therefore, when the brake pads wear down, the friction force decreases and the braking distance increases.

When to replace the Brake Pads

If you hear the brakes squeal when you step on the brake pedal, it is a sign that the pads have worn down. You should immediately take your car to a Mitsubishi authorized dealer to have the brake pads replaced. We recommend that you periodically bring your car to a Mitsubishi authorized dealer for an inspection even if there is no squealing sound.

Good Reasons to use Mitsubishi Genuine Parts

We can do it because we are "MITSUBISHI"

The heat of friction due to braking can reach temperatures of 400°C to 500°C. Mitsubishi develops technology from its experience in motor sports, such as the WRC and Dakar Rally, and applies it to the production of Mitsubishi genuine parts. These brake pads are subjected to extreme durability and optimum operational tests.

Genuine Parts Provide Confidence

1. Stability: Stable braking performance is obtained to match the driving speed.
2. Heat resistance: Stable braking performance is obtained under a wide range of temperatures.
3. Wear resistance: The optimum balance between brake performance and wear resistance is secured under a variety of usage conditions and environments.
