Is your car in the best possible condition?

You may notice that your car is having problems lately. Have you recently performed any maintenance? Performance decreases over time, and if neglected, serious problems may occur. As the owner, you are responsible for making sure that it operates correctly.

Appropriate maintenance will keep your car in the best condition

By caring for your car, you can keep it in good condition. Simply replacing wear-and-tear parts and items will improve the ride comfort and driving performance. You will once again have that feeling of when you first drove it.

OIL FILTERS

What happens if you do not replace the oil filters?

1

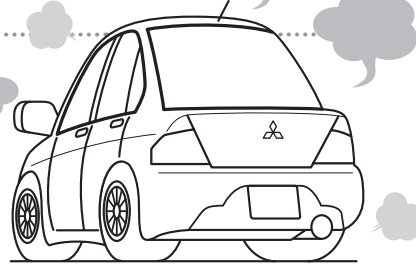

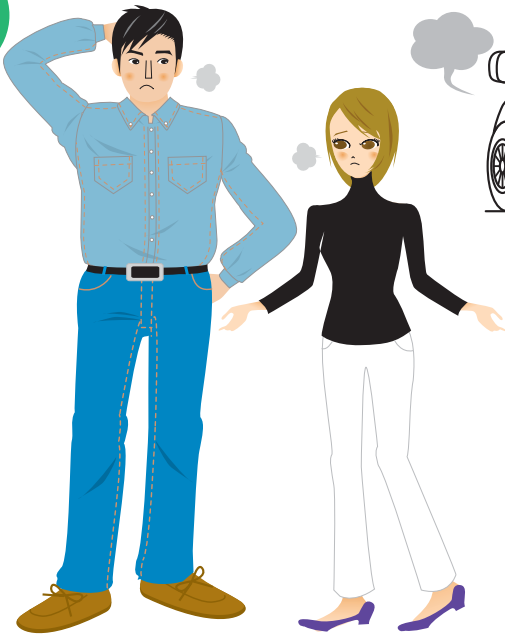

The engine might seem noisy.

2

Bring your car to a Mitsubishi authorized dealer for an inspection... or you will have...

3

Trouble!?

◆ Why does this happen?

While the oil filter is designed to remove impurities from the engine oil to maintain clean oil, the filter gradually becomes clogged through continued use. When this happens, some of the oil will go through the bypass path without going through the filtering section because the passage area of oil shrinks due to clogging. In other words, oil containing impurities enters the engine's lubrication system, causing overheating or even serious damage to the engine.

◆ When to replace the Oil Filters

The effect of replacing the engine oil with new oil will be decreased if the oil filter remains dirty. Also, there is no means to inspect the filter for clogging. Therefore, periodically replace the filter by deciding a proper replacement cycle. We recommend that you have the oil filter replaced once every two oil changes at a Mitsubishi authorized dealer.

Good Reasons to use Mitsubishi Genuine Parts

Developed Exclusively for Mitsubishi Engines

The engine oil is used to lubricate, cool and prevent rust within the engine. The Mitsubishi genuine oil filter realizes the full potential of the engine oil, and it keeps the Mitsubishi engine in the optimum condition at all times.

Genuine Parts Provide Confidence

1. Filter performance: The filter captures the smallest of solid particles of less than 1 micron.
2. Filter area: The filter has a large filter area and great absorption capacity for impurities.
3. Sealed filter: The filter captures and filters dirty oil.
